

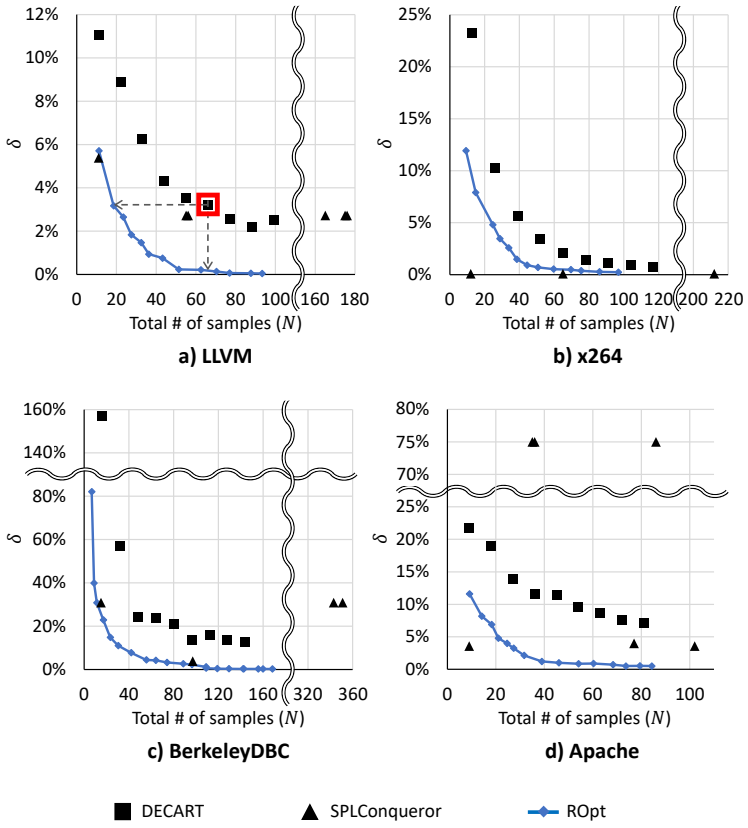

Figure 4.4: Accuracy comparison between ROpt and PM approaches.

results of ROpt obtained from **RQ1**. **Note:** some plots of SPLConqueror have identical values and overlap with each other.

ROpt is more efficient than DECART for all HCSs and N. Consider a plot highlighted in red (▣) in Fig. 4.4a. For the same N, ROpt finds better solutions. To obtain a solution with similar performance, ROpt requires smaller N. Although both ROpt and DECART found better solutions with larger N, CART model takes the average performance of configurations as predicted performance which cannot be better than the best sampled configuration.
